Functor Categories

How to know if red wine makes you live longer?

- Do a pullback on multiple studies
 - What do both papers agree on?

Ex: Soft pullback reconciliation: resveratrol => mitochondrial biogenesis

Pullbacks:

- an object in a category, such that the domain after two parallel function paths is equivalent

Markov Category

- Symmetric monoidal category where each object can be 'copied' or 'deleted' (pullbacks do not exist)
- If you have an object X , you can get 2 of them. You can also delete X . Can visualized as a string diagram! (symmetric monoidal category)
- Can get all of probability theory just from symmetric monoidal categories?
 - 'A synthetic approach to Markov kernels, conditional independence and theorems on sufficient statistics'

2.1. Definition. A Markov category \mathbf{C} is a symmetric monoidal category in which every object $X \in \mathbf{C}$ is equipped with a commutative comonoid structure given by a comultiplication $\text{copy}_X : X \rightarrow X \otimes X$ and a counit $\text{del}_X : X \rightarrow I$, depicted in string diagrams as

$$\text{copy}_X = \begin{array}{c} \bullet \\ \cup \\ | \end{array} \quad \text{del}_X = \begin{array}{c} \bullet \\ | \end{array} \quad (2.1)$$

and satisfying the commutative comonoid equations,

$$\begin{array}{c} \bullet \\ \cup \\ \cup \\ \bullet \end{array} = \begin{array}{c} \bullet \\ \cup \\ \cup \\ \bullet \end{array} \quad (2.2)$$

$$\begin{array}{c} \bullet \\ \cup \\ | \end{array} = | = \begin{array}{c} | \\ \cup \\ \bullet \end{array} \quad \begin{array}{c} \bullet \\ \cup \\ \cup \\ \bullet \end{array} = \begin{array}{c} \bullet \\ \cup \\ \bullet \end{array} \quad (2.3)$$

as well as compatibility with the monoidal structure,

$$\begin{array}{c} \bullet \\ | \\ X \otimes Y \end{array} = \begin{array}{c} \bullet \\ | \\ X \end{array} \begin{array}{c} \bullet \\ | \\ Y \end{array} \quad \begin{array}{c} X \otimes Y \quad X \otimes Y \\ \cup \\ \bullet \\ | \\ X \otimes Y \end{array} = \begin{array}{c} X \quad Y \quad X \quad Y \\ \cup \quad \cup \\ \bullet \quad \bullet \\ | \quad | \\ X \quad Y \end{array} \quad (2.4)$$

and naturality of del , which means that

$$\begin{array}{c} \bullet \\ \boxed{f} \\ | \end{array} = \begin{array}{c} \bullet \\ | \end{array} \quad (2.5)$$

for every morphism f .

Intuition behind 2.2, 2.3 (read bottom to top)

- 2.2 Doesn't matter which copy you copy
- 2.3 Copy and then deleting one is the same as doing nothing, same with switching copies around (copies are the same)
- 'Think of string diagram as a flow of information through a category'
 - Very suitable to model causal inference
- 2.4 deleting a product is same as deleting them separately, you can duplicate products and it is the same as duplicating things separately
- Deleting a function of something is the same as deleting without the function (function doesn't matter) -> might this be related to information deletion causing entropy creation?

Conditional Distribution generalizes $P(X, Y) = P(Y|X)P(X)$

$$\psi : I \rightarrow X \otimes Y$$

Conditional Distribution

Generalizes $P(X, Y) = P(Y|X) P(X)$

If you have a joint distribution and delete one of the joints, you can re-create the joint using a conditional slice of the joint.

Conditional independence

$P(X, W, Y) = P(X | W) P(Y | W)$

If you know something about a 3rd variable W , you can factor a joint distribution

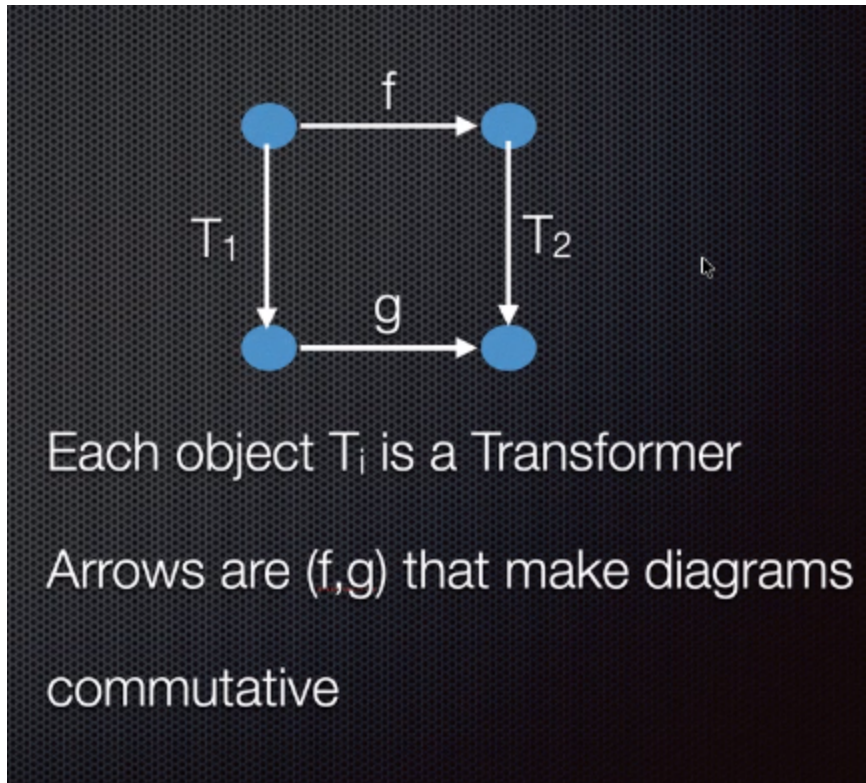

Yoneda Lemma reviewed:

- For any object x in category C , its embedding $C(x, -)$ is a set-valued functor (also called a copresheaf). If each object in these diagrams is a set-valued functor, pullbacks always exist.

Pullbacks in Transformer Category

- We want to prove that in a category of sequence-to-sequence functions, pullbacks exist

- We reduce the problem to pullback in the category of sets.

Day: Wed, Feb 18 12026

Pullbacks abstract over many concrete operations:

- intersection, preimage/inverse image, fibered product (including cartesian product), logical conjunction maximum / meet

Limits over a time series

- You have natural numbers as an indexing category (arrow = +1?)
- Limit must have a projection to each object in the induced diagram,

Diagrammatic Backpropagation

- Extend vanilla backprop to include diagrammatic reasoning, encode compositional constraints
 - "triangular constraints", "rectangular constraints"
 - (basically commutative diagrams)

Day: Wed, Feb 11 12026

Yoneda Lemma generalized to Metric Spaces

- This is core to Diagrammatic Backprop I think, you are trying to impose the yoneda lemma onto the learned structure of transformer

Generalized Metric Space: reflexivity, triangle inequality (not symmetric distances, distances are finite, distances between two different objects cannot be 0)

Metric Yoneda Lemma for generalized metric spaces

Day: Mon, Feb 9 12026

Yoneda takes objects (x) turns them into Functors

- What does the functor do? It takes objects from the category (including x itself) to Sets
- Turns any category into a category of functors, where morphisms are isomorphisms
 - Have all the structure of a set (Topos)

Talks about functors and natural transformations, naturality square.

Talks about Graphs as naturality squares

Day: Mon, Feb 2 12026

Downloaded the textbook and read the first chapter. It covered:

- Categories - Definition
- Transformer as a sequence-to-sequence $\mathbb{R}^{n \times d} \rightarrow \mathbb{R}^{n \times d}$
- Commutative Diagrams
- Slice categories as a way to make make "function as object" topoi
-
